Internet Programming

29/10/2026

Name : Harshad Sanjay Teli.

Roll No : 15

Batch : B1

Assignment-10

1. Dynamic To-Do List (addEventListener + onkeypress)

Create a To-Do list application:

- User types a task in an input box.
- When Enter key is pressed → Add task to list.
- Each task must have:
  - A delete button (onclick)

Input:

```
<!DOCTYPE html>

<html>
<head>
  <title>To Do List</title>
</head>
<body>

  <h2>My To Do List</h2>

  <input type="text" id="task" placeholder="Enter your task">
  <button onclick="addTask()">Add Task</button>

  <ul id="list"></ul>

  <script>

    let input = document.getElementById("task");

    input.addEventListener("keypress", function(event) {
      if(event.key == "Enter") {
        addTask();
      }
    });

    function addTask() {
      let task = input.value;

      if(task == "") {
        alert("Please enter a task");
      }
      else {
        let li = document.createElement("li");

        li.innerHTML = task +
        " <button onclick='this.parentElement.remove()'>Delete</button>";
```

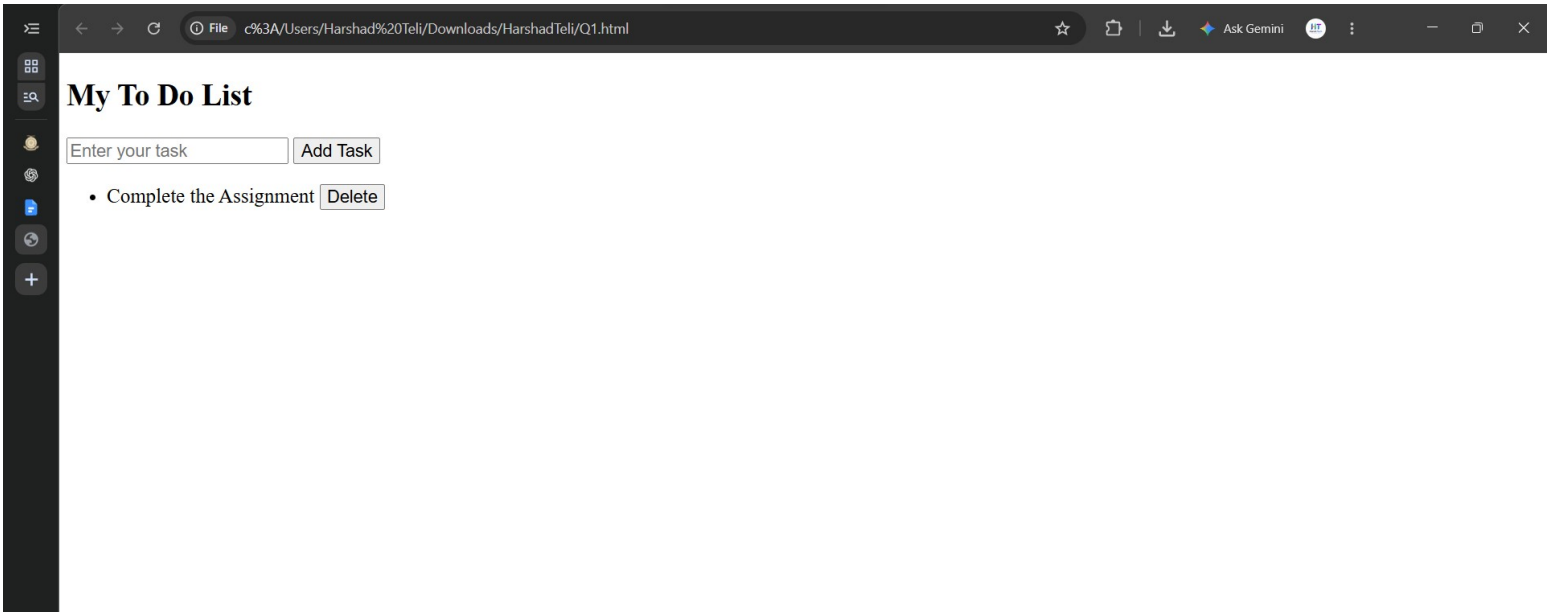

```
      document.getElementById("list").appendChild(li);

      input.value = "";
    }
  }

 </script>

</body>
</html>
```

Output:

2. Form Validation (onsubmit + RegExp + preventDefault)

Create a **Registration Form** with fields:

- Name
- Email
- Phone
- Password
- Confirm Password

On form submit:

- Validate email format
- Validate phone = 10 digits
- Password & confirm password must match
- If any validation fails → show messages under each field
- Use event.preventDefault() to stop submission.

Input:

```
<!DOCTYPE html>

<html>
<head>
  <title>Registration Form</title>
</head>
<body>

  <h2>Registration Form</h2>

  <form onsubmit="return validateForm(event)">

    Name:
    <input type="text" id="name">
    <span id="nameError"></span>
    <br><br>

    Email:
    <input type="text" id="email">
    <span id="emailError"></span>
    <br><br>

    Phone:
    <input type="text" id="phone">
    <span id="phoneError"></span>
    <br><br>

    Password:
    <input type="password" id="password">
    <span id="passError"></span>
    <br><br>

    Confirm Password:
    <input type="password" id="confirm">
    <span id="confirmError"></span>
    <br><br>
```

```
  <button type="submit">Register</button>

</form>

<script>

  function validateForm(event) {

    event.preventDefault();

    let name = document.getElementById("name").value;
    let email = document.getElementById("email").value;
    let phone = document.getElementById("phone").value;
    let password = document.getElementById("password").value;
    let confirm = document.getElementById("confirm").value;

    document.getElementById("nameError").innerHTML = "";
    document.getElementById("emailError").innerHTML = "";
    document.getElementById("phoneError").innerHTML = "";
    document.getElementById("passError").innerHTML = "";
    document.getElementById("confirmError").innerHTML = "";

    let valid = true;

    let emailPattern = /^[^\s@]+@[^\s@]+\.[^\s@]+$/;
    let phonePattern = /^[0-9]{10}$/;

    if(name == "") {
      document.getElementById("nameError").innerHTML = "Enter name";
      valid = false;
    }

    if(!emailPattern.test(email)) {
      document.getElementById("emailError").innerHTML = "Invalid Email";
      valid = false;
    }

    if(!phonePattern.test(phone)) {
      document.getElementById("phoneError").innerHTML = "Enter 10 digit phone number";
      valid = false;
    }

    if(password == "") {
      document.getElementById("passError").innerHTML = "Enter password";
      valid = false;
    }

    if(password != confirm) {
      document.getElementById("confirmError").innerHTML = "Password does not match";
      valid = false;
    }

    if(valid) {
      alert("Registration Successful!");
    }

    return false;
  }

</script>
```

```
</body>
</html>
```

Output:

3. Character Counter (keyup)

Create a textarea with:

- A live character count (updates on every key press)
- If character count > 200 →
  - Textarea border turns red
  - Disable “Submit” button

Input:

```
<!DOCTYPE html>

<html>
<head>
  <title>Character Counter</title>
</head>
<body>

  <h2>Character Counter</h2>

  <textarea id="text" rows="5" cols="40"
  placeholder="Enter your text"></textarea>

  <p>Character Count: <span id="count">0</span>/20</p>

  <button id="submit">Submit</button>

  <script>

    let textarea = document.getElementById("text");
    let count = document.getElementById("count");
    let button = document.getElementById("submit");

    textarea.addEventListener("keyup", function() {

      let total = textarea.value.length;

      count.innerHTML = total;

      if(total > 20) {
        textarea.style.border = "2px solid red";
        button.disabled = true;
      }
      else {
        textarea.style.border = "2px solid black";
        button.disabled = false;
      }

    });

    button.onclick = function() {
      alert("Submitted Successfully!");
    };

  </script>

</body>
</html>
```

Output:

File
c%3A/Users/Harshad%20Teli/Downloads/HarshadTeli/Q3.html
Ask Gemini
Character Counter
Hello I am Harshad Teli from Indian.
Character Count: 36/20
Submit

4. Dark Mode Toggle (onclick)

Create a toggle button:

- When clicked → apply dark mode (black background + white text)
- When clicked again → switch back to light mode
  Use classList.toggle().

Input:

```
<!DOCTYPE html>

<html>
<head>
  <title>Dark Mode</title>

  <style>

    body {
      background-color: white;
      color: black;
      text-align: center;
    }

    .dark {
      background-color: black;
      color: white;
    }

  </style>

</head>
<body>

  <h2>Dark Mode Toggle</h2>

  <p>Click the button to change the theme.</p>

  <button onclick="changeMode()">Toggle Dark Mode</button>

  <script>

    function changeMode() {

      document.body.classList.toggle("dark");

    }

  </script>

</body>
</html>
```

Output:

File
c%3A/Users/Harshad%20Teli/Downloads/HarshadTeli/Q4.html
Ask Gemini
Dark Mode Toggle
Click the button to change the theme.
Toggle Dark Mode
